

Title: Scientific Diplomacy at the Intersection of Research and International Affairs

Date: 20 January, 2026

Scientific diplomacy is gaining clear momentum. In Poland and internationally, it is increasingly recognised as a critical area at the intersection of research, education, technology, and international affairs. As technological development accelerates and translates into political and strategic influence, public awareness is also growing: innovation is driven by research, science, and advanced education.

In this context, in December I had the pleasure of taking part in a panel discussion on scientific diplomacy, alongside two esteemed professors from our university. I would like to thank the **Regionalny Ośrodek Debaty Międzynarodowej** (Center for International Debate) for the invitation and for the opportunity to contribute as a member of the International Relations Department and as the Rector's representative.

These developments place responsibility on us—both individually and institutionally—to communicate the value of our research more effectively. They also call for actively seeking collaboration, building scientific networks, and fostering international partnerships that support academic growth while strengthening institutional visibility through high-quality, credible research.

An important point raised during the discussion was the need for the diplomatic community to better understand scientific methods and decision-making processes. Much like in engineering or other technical fields, scientific authority, validation, and responsibility operate differently than in political contexts. Recognising these differences is essential when designing public–scientific initiatives and policies that rely on expert knowledge.

Thank you to the organisers and fellow panelists for a thoughtful and timely discussion.
